It has all the features of a movie and TV player.. ... install the "Allplayer portable" file on your Windows computer from: "C:\Program Files (x86)\Allplayer Portable\Allplayer.exe". Plantarflexor activity on the hemiparetic side after unilateral and bilateral stroke. Spasticity results from changes in the properties of the muscle spindle and muscle stretch reflex. Decreased electromyographic (EMG) activity of lower limb muscles associated with the stroke has been widely reported, and constitutes one of the characteristics of increased muscle tone after hemiplegia. The aim of this study was to understand the relationship between the changes in muscle tone and lower limb kinematics in patients with hemiplegia after stroke. Using six-channel electromyography (EMG) and video-recorded force platform data, kinematics and muscle activity during plantarflexion of the affected and unaffected sides were assessed for nine stroke patients with spastic hemiplegia. Analysis of EMG data showed that reflex responses on the hemiplegic side were greater than those on the unaffected side in all subjects. The results of correlation and regression analysis showed that reflex responses on the hemiplegic side could be predicted from the ankle joint angle on the contralateral side. In addition, a stronger correlation was found between reflex responses on the hemiplegic side and ankle and knee joint angles, which probably reflected the co-activation of antagonist muscles and the biceps femoris muscle on the hemiplegic side. The results of this study suggest that the contralateral ankle 3ef4e8ef8d
