Category:Freeware Category:Formerly proprietary software Category:Video softwareQ: Binary literals How are binary literals in  
Python handled? I am new to programming in general. I was wondering how binary literals work in Python. If I use a binary  
literal >>> print b'11010011' will the output be 1 or 11? A: In Python, binary literals use one or more octal or hexadecimal  
digits, followed by a dot. The binary literal b'11010011' expands to b'1.1.1.1.'. A: As mentioned here, if you want to format the  
binary as hex, use '0x'. So, '11010011' will output 1.1.1.1. As a further note, you can also use the syntax '0b11010011' to format  
as binary. import sys print('1.1.1.1.') # works print('0x11010011') # works print('0b11010011') # works print('0b10100011') #  
doesn't work print('0b11001101') # works, and produces 0b101010011 print('0b11010100') # works, and produces 0b11010100  
print('0b11010011') # doesn't work print('0b10101011') # works, and produces 0b11010100 print('0b10010101') # works, and  
produces 0b11010100 print('0 2d92ce491b
